Hello World!

GitHub Repository

```
#include <stdio.h>
int main() {
   printf("Hello, World!");
   return 0;
}
```

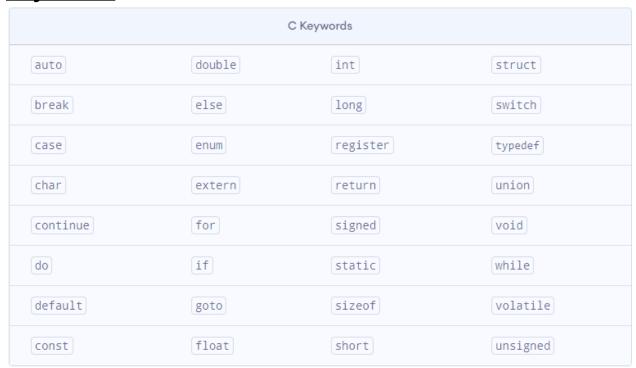

Syntax

Structure of C Program

	1	#include <stdio.h></stdio.h>	Header		
	2	int main(void)	Main		
	3	{			
DY	4	printf("Hello World");	Statement		
ВО	5	return 0;	Return		
	6	}			

Keywords and Identifiers

Keywords: Reserved words.

Identifier:

Name of Variable, Function.

C Variables, Constants

Variables: a variable is a container (storage area) to hold data.

Constants: whose value cannot be changed

Data Types

Basic types

Here's a table containing commonly used types in C programming for quick access.

Туре	Size (bytes)	Format Specifier
int	at least 2, usually 4	%d), (%i)
char	1	%c
float	4	(%f)
double	8	[%1f]
short int	2 usually	%hd
unsigned int	at least 2, usually 4	%u
long int	at least 4, usually 8	(%ld), (%li)
long long int	at least 8	[%11d], [%11i]
unsigned long int	at least 4	(%lu)
unsigned long long int	at least 8	(%11u)
signed char	1	%c
unsigned char	1	%c

Input Output (I/O)

Format Specifiers for I/O

As you can see from the above examples, we use

- %d for int
- %f for float
- %lf for double
- %c for char

ASCII TABLE

Decimal	Hexadecimal	Binary	0ctal	Char	Decimal	Hexadecimal	Binary	0ctal	Char	Decimal	Hexadecimal	Binary	0ctal	Char
0	0	0	0	[NULL]	48	30	110000	60	0	96	60	1100000	140	`
1	1	1	1	[START OF HEADING]	49	31	110001	61	1	97	61	1100001	141	a

Operators

Online Compiler

C Arithmetic Operators

An arithmetic operator performs mathematical operations such as addition, subtraction, multiplication, division etc on numerical values (constants and variables).

Operator	Meaning of Operator
+	addition or unary plus
-	subtraction or unary minus
*	multiplication
/	division
%	remainder after division (modulo division)

C Assignment Operators

An assignment operator is used for assigning a value to a variable. The most common assignment operator is

Operator	Example	Same as
=	a = b	a = b
+=	a += b	a = a+b
-=	a -= b	a = a-b
*=	a *= b	a = a*b
/=	a /= b	a = a/b
%=	a %= b	a = a%b

C Relational Operators

A relational operator checks the relationship between two operands. If the relation is true, it returns 1; if the relation is false, it returns value 0.

Relational operators are used in decision making and loops.

Operator	Meaning of Operator	Example
==	Equal to	5 == 3 is evaluated to 0
>	Greater than	5 > 3 is evaluated to 1
<	Less than	5 < 3 is evaluated to 0
!=	Not equal to	5 != 3 is evaluated to 1
>=	Greater than or equal to	5 >= 3 is evaluated to 1
<=	Less than or equal to	5 <= 3 is evaluated to 0

C Logical Operators

An expression containing logical operator returns either 0 or 1 depending upon whether expression results true or false. Logical operators are commonly used in decision making in C programming.

Operator	Meaning	Example
&&	Logical AND. True only if all operands are true	If $c = 5$ and $d = 2$ then, expression $((c==5) \&\& (d>5))$ equals to 0.
II	Logical OR. True only if either one operand is true	If $c = 5$ and $d = 2$ then, expression $((c==5) (d>5))$ equals to 1.
!	Logical NOT. True only if the operand is 0	If c = 5 then, expression (!(c==5)) equals to 0.

Size of Variables:

sizeof(variable)

we use either %lu or %zu format specifier.

Introduction Example:

- 01.C program to print an integer, float, double & character value entered by the user
- 02. C program to find ASCII value of a character entered by the user
- 03. C program to find the size of int, float, double and char
